Beginning
Discrete Harris hawks optimization
Read the FJSP instance and set the evaluation budget
Mixed initialization of the hawks and evaluation of every hawk
Set the rabbit and the first anchor
Compute the escaping energy E of hawk x
|E| ≥ 1
Choose the move
|E| < 1, r < 0.5
|E| < 1, r ≥ 0.5
Exploration learn from a random hawk
Soft or hard besiege learn from rabbit
Rapid dives greedy Y, then Lévy edits Z
Update the rabbit and the anchors
NO
All hawks moved?
YES
NO
Budget used up?
YES
Ending: best schedule
Mycelial Search on the best hawks
Build the fusion graph on hawks and anchors
Louvain communities and potentials of all nodes
Take the next tip
Flow: learn from neighbours by message weight
Update the cord conductance
Hyphal growth along critical-path moves
NO
All tips processed?
YES
Ridge-oriented injection from two anchors
